

2009 S3/WHEEL COMPATIBILITY

To know if your wheel's spokes will fit between the chain stays the S3 put the wheel in question into any frame. Place a ruler flush against the inboard side of the rear drop out so that the ruler points to the front of the bike.

Measure 50 mm towards the front of the bike from the centerline of the rear wheel's axle. With another ruler placed at right angles to the original ruler, measure from that 50 mm point towards the centerline of the bike. If the distance to the outboard aspect of the spoke of the wheel in question is more than 27 mm at this point you will not experience any issue with using that wheel with your S3.

If the distance to the outboard aspect of the spoke of the wheel in question is between 25.5-27 mm your wheel still may work with the S3 but will depend on the lateral stiffness of the wheel.

Measurements of 25.5 mm or less should not be used on the S3.

For specific information on a wheel's measurements please contact the manufacturer of the wheel directly.
